The polypucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous system ilseases, such as localised neuropathies and central nervous system diseases, such as localised neuropathies and central nervous system diseases, such as liceases, such as alzeiner's, Parkinson's disease, Huntington's disease, such as lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, and thrombolytic activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, cancer diagnosis and inflammation, leukaemias and Noter The Section of the fortilisation of the section of the section as the fortilisation of the section as the fortilisation of the section of the activity, democratic and inflammation, leukaemias and Noter The Section of the section

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           peripheral nervous system; neuropathy; central nervous system; CNS; parkinson's disease; Huntington's disease; haemostatic; amyotrophic lateral sclerosis; Shy-Drager Syndrome; chemotactic; chemokinetic; thrombolytic; drug screening; arthritis; inflammation;
         The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polypucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and localised neuropathies and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activity, chemotactic/chemokinetic activity, haemostatic activity, haemostatic activity, haemostatic activity, haemostatic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AAI61241;

nucleic acids, proteins, antibodies and (antiagonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer, and other cancers of the adrenal gland, bone, bone marrow, breast, gastrointestinal tract, liver, lung, or urogenital; (b) immune disorders e.g. Addison's disease, allergies, autoimmune thyroiditis, diabetes mellitus, crohn's disease, multiple sclerosis, rheumatoid arthritis and ulcerative colitis; (c) cardiovascular disorders such as myocardial ischaemias; (d) wound healing; (e) neurological diseases e.g. cerebral anoxia and epilepsy; and (f) infections diseases such as viral, bacterial, fungal and parasitic infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  12-MAR-1999;

                                                                                                                                                                                                                                          The invention relates to the isolation of genes AAA58990-A59039 encoding 50 human secreted proteins AAB27560-B27609. The genes can be used to generate fusion proteins by linking to the gene for the human immunoglobulin G Fc portion (SEQIDI) for increasing the stability of the fusion protein as compared to the human protein only. The genes and proteins are useful for preventing, ameliorating or treating medical conditions, e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The
                                                                                                                                                                                                                                                                                                                                                                                                                              Claim 1; Page 372; 428pp; English.

CC The present sequence is one of 3351 sequences in a library of human CC polynucleotides. The library is used to detect differentially expressed CC genes correlated with a cancerous state of a mammalian cell and can CC detect colon, prostate, breast and lung cancer. The library can be used CC to produce probes for detection of mRNA and to produce additional copies CC of the polynucleotides. The probes can be used for chromosome mapping of CC the polynucleotide and for detection of transcription levels. Ribozymes CC or antisense oligonucleotides can be generated. The polynucleotides and CC their gene products are used as genetic or biochemical markers (e.g. in blood or tissues) that will detect the earliest changes along the CC carcinogenesis pathway and/or monitor the efficacy of therapies and CC antibodies against them can be used in pharmaceutical compositions to treat the cancers and proliferative disorders such as neoplasia, CC dysplasia and hyperplasia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Williams LT, Escobedo J, Reinhard C, Randazzo F, Crkenjakov R, Drmanac S,

                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to human single exon nucleic acid probes (SENP). The present sequence is one such probe. The SENPs are derived from human HeLa cells. The SENPs can be used to produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical epithelial cells. By measuring gene expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably cervical cancer.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at the probability of the probability of the printed specification, but was obtained in electronic format directly from WIPO

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to single exon nucleic acid probes (SENP). The present sequence is one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of human genetic disorders.

                                                                                                                                                                                                                                                                          The present invention relates to novel single exon nucleic acid probes. The present sequence is one such probe. The probes are useful for measuring human gene expression in a human breast sample, where the prohybridises at high stringency to a nucleic acid expressed in the human breast. The probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human breast, staging, those diseases with polygenic actiology. The diseases include: breast cancer, disorders of development, inflammatory diseases of the breast, fibrocystic changes, proliferative breast disease and non-carcinoma tumours.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              09-OCT-2001

                                                                                    microarray, which can be used for measuring human gene expression in a sample derived from human cervical epithelial cells. By measuring gene expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably cervical cancer.

Note: The sequence data for this patent did not form part of the printe specification, but was obtained in electronic format directly from WIPC
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Probe; human; microarray; gene expression; cervical epithelial cell;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Probe #708 for gene expression analysis in human cervical cell sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AAI10775 standard; DNA; 436

                                                                                                                                                                                                                                                                                             The present invention relates to single exon nucleic acid probes (SENP). The present sequence is one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in sample; derived from human placenta. The probes are useful for antenatal diagnosis of human genetic disorders.
                                                                                                                                                                                                                                             Sequence 436 BP; 105 A; 127 C; 117 G; 87 T; 0 other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Дb
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       DЬ
      The present invention relates to novel single exon nucleic acid probes. The present sequence is one such probe. The probes are useful for measuring human gene expression in a human breast sample, where the probe hybridises at high stringency to a nucleic acid expressed in the human breast. The probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human breast, particularly those diseases with polygenic aetiology. The diseases include: breast cancer, disorders of development, inflammatory diseases of the breast cancer, disorders of development, inflammatory diseases of the breast, fibrocystic changes, prolliferative breast disease and non-carcinoma tumours.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at fip. wipo.int/pub/published_pct_sequences.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AAF75507 standard; DNA; 486
      The present invention describes a method of screening for genes which modulate polyglutamine toxicity using animal models with polyglutamine sequences that cause toxicity in the animal. The model is preferably brosophila, and toxic polyglutamine sequences include the human and

The LANA protein is necessary for the efficient persistence of rhadino virus DNA in mammalian cells. Persistent rhadino virus infection is implicated in a variety of diseases e.g. kaposi's Sarcoma (KS), Primary Effusion Lymphoma (PEL) and multicentric Castleman's disease. In addition, KS is a common malignancy in HTV patients. KSHV persists in host cells in a latent form. One of the few genes expressed from the latent viral DNA is LANA, LANA associates with both human chromosomes and with the rhadino virus cis-acting element (RVCAE), thereby providing a tethering function: the KSHV DNA episome is "tied" to the host chromosomes. This allows the viral DNA to persist in the host cohromosomes. This allows the viral DNA to persist in molecules that inhibit LANA interaction with RVCAE, thereby interfering with the latency cycle of this virus. Potential antiviral treatments for the host call after a series of the viral bank directions for the host call. The present sequence with RVCAE.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          2037
```

The invention provides a composition comprising nucleic acid, histone HI protein and expression vector operationally encoding a protein suitable for tethering the nucleic acid to the histone HI protein, where the tethering protein is LANA. The composition is useful in aiding the retention of the viral DNA in the host cell. The viral vector encodes a protein suitable for tethering DNA to Histone HI. Methods for screening

The composition has applications to gene therapy, including the treatment of multiple sclerosis, parkinson's disease, Huntington disease and diabetes. The present sequence represents the nucleotide sequence of the Kaposi's sarcoma associated herpesvirus (human herpesvirus 8) latency-associated nuclear antigen (LANA), which acts as a tethering protein.

This fragment contains coding regions for ORF65 which encodes capsid protein IV, ORF66, ORF67 which encodes tegument protein IV, ORF68 which encodes a glycoprotein, ORF69, K12 which encodes kaposin, K13, ORF72 which encodes cyclin D, ORF69, K12 which encodes kaposin, K13, ORF72 which encodes cyclin D, ORF73 which encodes immediate early protein (IEP), K14 which encodes OX-2 (V-adh), ORF74 which encodes G-protein coupled receptor, ORF75 which encodes tegument protein/FGARAT, K15, KSHV is a new human Herpesvirus (HHV8) believed to cause Kaposi's sarcoma (KS) which is the most common form of neoplasm occurring in persons with acquired immune deficiency syndrome (AIDS). The DHFR protein is useful for vaccination, prophylaxis, diagnosis and treatment of a subject with Kaposi's sarcoma and for detecting expression of a DNA virus associated with Kaposi's

                                                                                                                                                                                                                                                                interferon regulatory factor 1
     This sequence represents the long unique region and terminal repeat of the Kaposi's sarcoma-associated herpes virus (KSHY). KSHY is also known as human herpes virus 8 (HHV8). This sequence contains the DNAs of the invention which encode KSHY polypeptides selected from: (a) viral can be invention which encode KSHY polypeptides selected from: (a) viral frequency protein (MIP) II; (b) viral interleukin-6 (II-6); (c) viral IRF 1; (d) complement-binding protein; glycoproteins B, M or L; (d) capsid protein IV encoded by ORF65; and (e) immediate early protein encoded by ORF63 that belied probes for the nucleic acid, proteins encoded by it, and antibodies (Ab) specific for the proteins are useful for concluded by ORF63; had (e) immediate early protein encoded by it, and antibodies (Ab) specific for the proteins are useful for concluded by ORF63; and (e) it have a second in the protein gamples. HHV8 infections can be treated with antisense error triplex forming molecules or agents that bind specifically to the protein. Ab may be used for prophylaxis or treatment of HHV8 infection, while the protein can be used in protective vaccines. Ab may also be used to differentiate between lymphomas, and HHV8 may be implicated in many cother lymphoproliferative diseases such as lymphomas, leukaemia, splenomegaly and mycosis fungoides. Cells and animals containing the used as targets for antivital drugs, e.g. dihydrofolate reductase gene can be inhibited with methotrexate. These can also be used to determine the inhibited with methotrexate. These can also be used to determine can be used to determine the inhibited with methotrexate. These can see the second as containing frames.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     NCBI_TaxID=4932;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       P14922;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         FUNCTION: IT IS INVOLVED IN REPRESSION BY A1-ALPHA2 AND ALPHA2 AND IN OTHER SYSTEMS AS A GENERAL REPRESSOR OF TRANSCRIPTION. THIS PROTEIN HAS NO OBVIOUS DNA-BINDING DOMAINS. IT MIGHT NOT INTERACT DIRECTLY WITH DNA BUT WITH DNA-BOUND PROTEINS.
SUBCELLULAR LOCATION: NUCLEAR.
                                                                                                                                                                                                                                                                                                                                                                                                                                                            SIMILARITY: CONTAINS 10 TPR REPEATS. Genes Dev. 4:1688-1700(1990).

-1- FUNCTION: MAY HAVE A REGULATORY FUNCTION POSSIBLY IN ASSOCIATION WITH THE N GENE PRODUCT.

-1- SUBCELLULAR LOCATION: NUCLEAR.
-1- DEVELOPMENTAL STAGE: DURING EARLY NEUROGENESIS MAM PRODUCTS ARE UBLOUTCOUSLY LOCATED. DURING LATER STAGES THEY ACCUMULATE IN THE CENTRAL NERVOUS SYSTEM.
-1- MISCELLANEOUS: THE PROTEIN HAS MANY AA HOMOPOLYMERIC DOMAINS: 21
POLY-GLN RUNS (FROM 5 TO 16 AA IN LENGTH), 4 POLY-GLY (6 TO 10 AA), 3 POLY-ASN (3 X 5 AA), 1 POLY-ALA (10 AA) AND 1 POLY-THR (5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 1448 TGATCAACAAGATCGACAAGAACGAAGACAGAAAAAAAGGAC 1488

HAIR FOLLICLES.  DOMAIN: MAINLY COMPOSED OF CYS-RICH (CR), GLY-RICH RICH (SR) REPEATS.  SIMILARITY: BELONGS TO THE UHS KERATIN FAMILY.	ZZ7:137-148(1999).  ZZ7:137-148(1999).  SUCH AND HAIR CONSIST OF MICROFIBRILS EMBEDDED I SUCH AS WOOL AND HAIR CONSIST OF MICROFIBRILS EMBEDDED I MATRIX OF OTHER PROTEINS. THE MATRIX PROTEIN INCLUDE THE SULFUR AND HIGH-TYROSINE KERATINS, HAVING MOLECULAR WEIGHT OF THE MICROFIBRILS CONTAIN THE LARGER, INCLEDED AND MICROFIBRILS CONTAIN THE LARGER, INCREATINS (40-56 KDA).
